Edit Rule

Transformation Rules / Routing, Sequence, Master Data, and Repetitions · routing

Save

Run only once per document

Rules re-run every time the document is saved. With this on, the rule applies at most once to a document and is then finished with it. A pass where the conditions don't match does not count as applied — the rule stays eligible and can still apply on a later save.

Also run after master data lookup NEW

Adds a pass once lookup fields are filled from master data and before PO matching, so the rule can use supplier master values and PO matching sees the result. Only rules with this ticked run in that pass. Because this rule applies once, it waits for this pass instead of applying right after extraction.

WHERE THIS RULE RUNS

Runs once per document: it waits for the master data lookup, then applies in the first pass where its conditions match.

After extraction	After master data lookup · new	After PO matching	On save
Waits for the lookup	Applies here	If not applied yet	If not applied yet

STEP 3 The pipeline

Read → Transform → Write

READ FROM `input`

Assign a fixed sub-organisation | **Map from a field**

SUED

Runs only when the conditions match. Once per document — applies the first time the conditions match, then never again on that document.

`sub_org_id` → **SUED** *unchanged*
